

Bug Report - Shaadi.com Registration Flow

Testing done on Sign Up / Registration pages

Bug 1: Month dropdown is not showing any values

What I found:

While filling the Date of Birth section, I clicked on the Month box to select my birth month. But nothing showed up, no list of months came, the box just stayed empty. Day and Year boxes are working fine, only Month has this issue.

Steps I did:

1. Go to shaadi.com sign up page
2. Fill First Name and Last Name
3. Go to Date of Birth section
4. Click on Month dropdown

What should happen (Expected):

It should show a list of all 12 months (Jan-Dec) to choose from.

What actually happens (Actual):

Nothing shows up when we click the Month box. No options are visible.

How serious it is:

High - user cannot complete the sign up because month can't be selected.

Bug 2: Form gets submitted even without ticking T&C; checkbox

What I found:

In the About Yourself page, there is a checkbox for agreeing to Privacy Policy and Terms & Conditions. I filled everything correctly but purposely did NOT tick that checkbox and clicked Continue. Still the page moved forward like everything was fine.

Steps I did:

1. Go to About Yourself registration page
2. Fill the About yourself text box
3. Do NOT tick the 'I agree to Privacy Policy and T&C;' checkbox
4. Click Continue button

What should happen (Expected):

It should not let us continue and should show an error/message to first accept the T&C.;

What actually happens (Actual):

Page moves to next step even without accepting T&C.; No validation error shown.

How serious it is:

High - this is a legal/compliance issue since T&C; acceptance should be compulsory.

Bug 3: Email field accepts wrong/invalid email format

What I found:

On the Email ID and Mobile number page, I typed a random junk text in the email box (not a proper email format) just to test, and the system accepted it without giving any error.

Steps I did:

1. Go to Email ID & Mobile no. page
2. Type an invalid email like a random long string with @ symbol (not proper email format)
3. Fill mobile number correctly
4. Click the checkmark/submit button

What should happen (Expected):

System should check if the email is in correct format and show an error if it's invalid.

What actually happens (Actual):

Invalid email gets accepted with no error message, form proceeds normally.

How serious it is:

Medium - can lead to fake/unusable emails being registered, which affects login and account recovery later.

Bug 4: About Yourself field accepts only spaces as valid content

What I found:

On the About Yourself page, I deleted the auto-filled text and instead entered just blank spaces (pressed spacebar multiple times) in the box, then clicked Continue. Since the field is marked mandatory (*), it should reject empty/space-only content, but it let me proceed.

Steps I did:

1. Go to About Yourself page
2. Clear the auto-generated text in the box
3. Type only spaces (press spacebar a few times, no real text)
4. Click Continue

What should happen (Expected):

System should treat space-only input as empty and show a 'This field is required' error, since it's a mandatory field.

What actually happens (Actual):

Space-only input is accepted as valid, form proceeds to next page.

How serious it is:

Medium - allows blank/meaningless profile descriptions to be saved, defeating the purpose of a mandatory field.

Bug 5: No visible maximum length restriction on Email field

What I found:

In the Email ID field, I typed a very long string of random characters before the @ symbol (much longer than a real email would ever be), and the system accepted the whole thing without cutting it off or showing any warning about length.

Steps I did:

1. Go to Email ID & Mobile no. page

2. In the Email ID field, type an extremely long string of characters followed by @ and a domain
3. Fill mobile number correctly
4. Click the checkmark/submit button

What should happen (Expected):

System should enforce a reasonable maximum character limit on the Email field and show a warning/error if it's exceeded.

What actually happens (Actual):

No length restriction is enforced, extremely long email text gets accepted as-is.

How serious it is:

Medium - allows unrealistic/garbage-length emails to be saved, which can cause issues in backend storage and email delivery.
